

Nested IF's

What does it do?

Nested IF conditions help in checking multiple conditions together by using IF conditions within IF condition.

Syntax

=if(Logical_Test, [value_if_true], if(Logical_Test, [value_if_true], [value_if_false]))

Logical_Test

This will be the condition which you want to check, so greater than, less than or equal to signs can be used for n
value, then use double quotes (") with equal to signs

Value_if_True

If the logical test holds, then excel will return this value

Value_if_False

If the logical test does not hold, then excel will return this value

Nested IF

From Excel 2007 onwards, we can use 64 IF conditions in one formula whereas Excel 2003 allows for only 7 IF co

Example

Use Nested IF to put the grade a student gets in an exam in Table B. Score Ranges for different grades are given

TABLE A	
Score	Grade
> 70	A
41-70	B
< 40	C

TABLE B			
Student ID	Marks	Grade	
S001	90	A	=IF(E26< 41,"C"
S002	70	B	=IF(E27< 41,"C"
S003	20	C	=IF(E28< 41,"C"
S004	41	B	=IF(E29< 41,"C"

Exercise

Write a formula using Nested IF conditions to check what level increment an employee should get and then con

TABLE A	
Performance	Increment
A	\$1,000
B	\$500
C	\$250

TABLE B			
Emp ID	Designation	Performance	Result
E001	AVP	A	\$ 1,000
E002	Analyst	A	\$ 1,000
E003	Analyst	B	\$ 500
E004	Analyst	C	\$ 250

numbers. When you want to evaluate a condition based on **text**

conditions

in Table A.

Formula
=IF(E26<71,"B","A")
=IF(E27<71,"B","A")
=IF(E28<71,"B","A")
=IF(E29<71,"B","A")

vert the amount into dollars using Format
